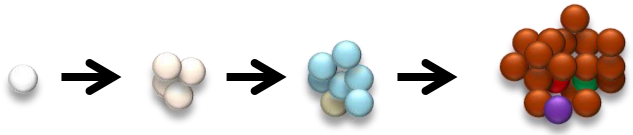
Introduction to B- and T-cell Clonality Testing & Targets

invivoscribe®
Improving Lives with Precision Diagnostics®

What is Clonality?

Clonality

- A proliferation of cells originating from a single progenitor cell, producing a **pool of identical clonal cells.**



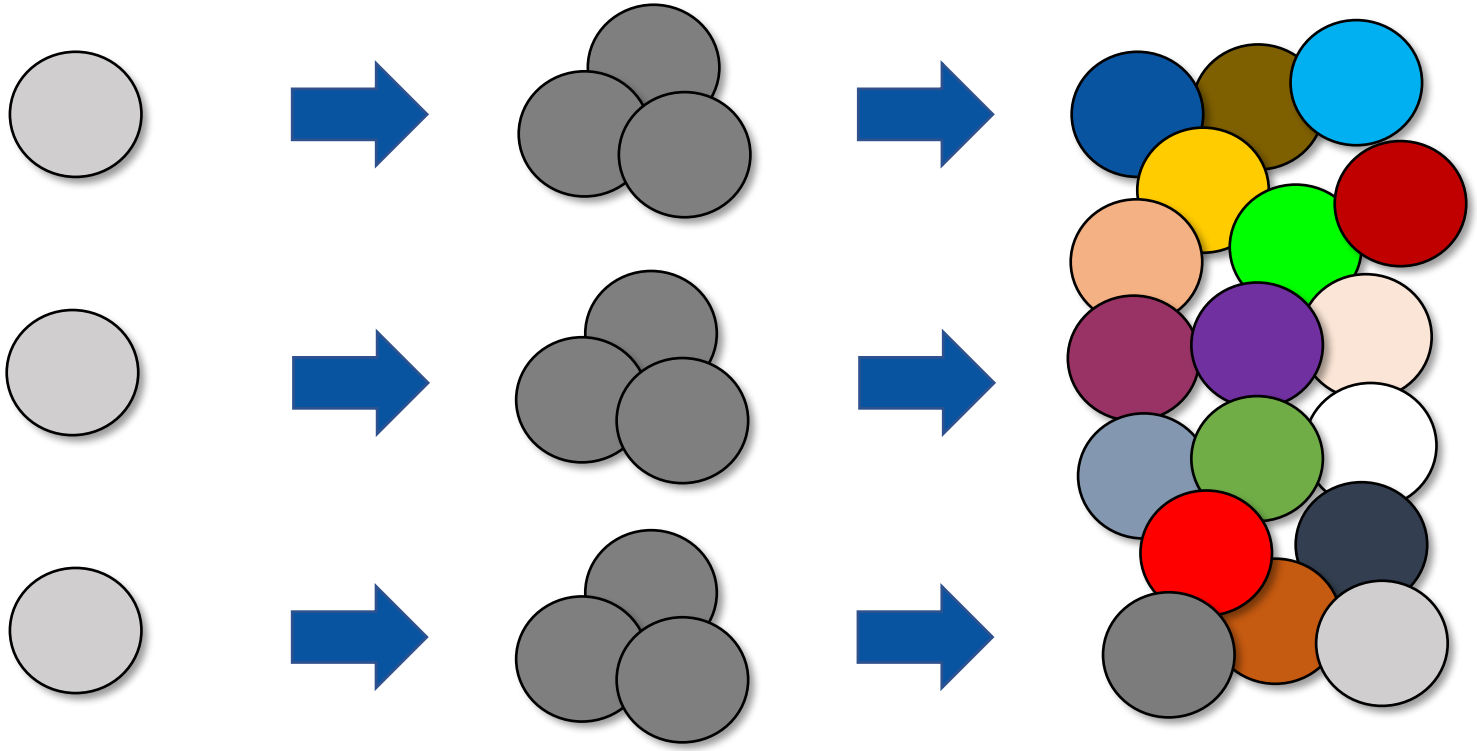
- Clonality testing using molecular techniques is used to **confirm the presence of leukemia or lymphoma.**

Highly indicative of B- or T-cell malignancy

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

What is Clonality?

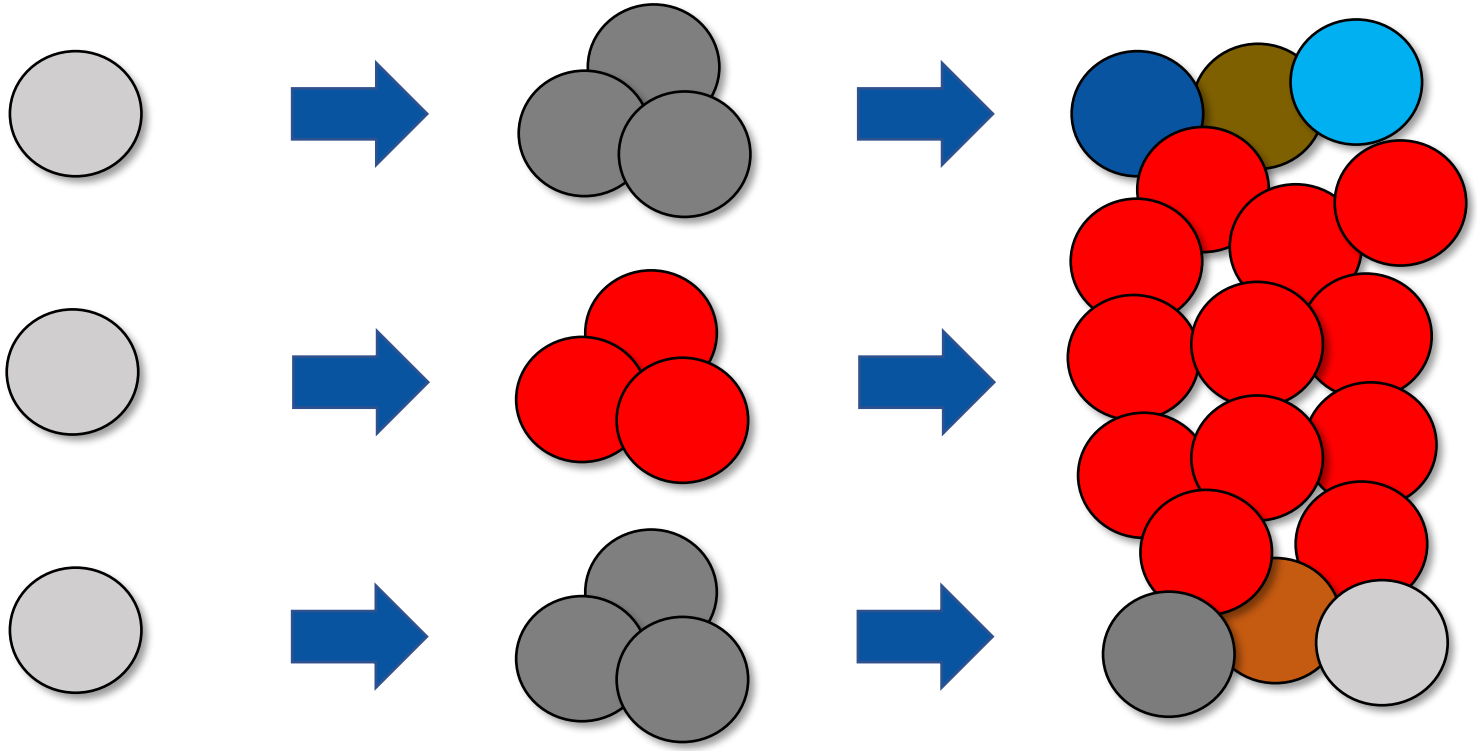
Polyclonal Progression



Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

What is Clonality?

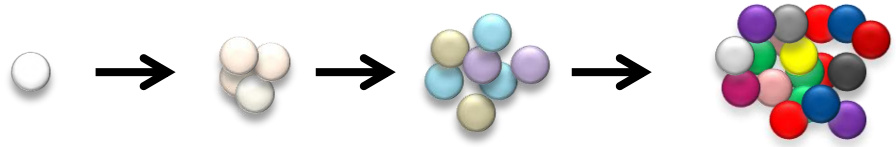
Clonal Progression

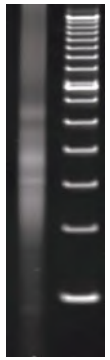


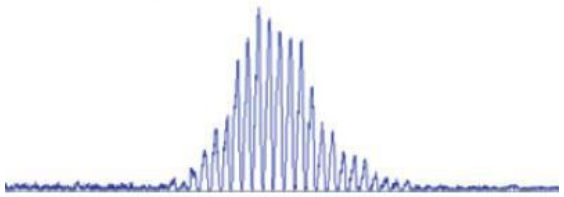
Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

What is Clonality?

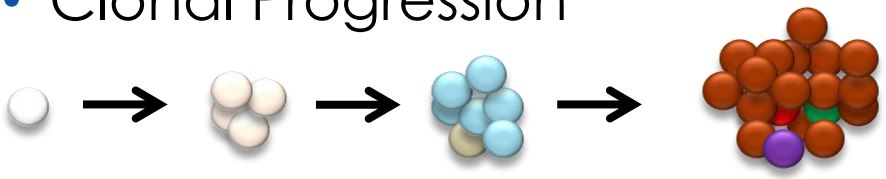
- Polyclonal Progression

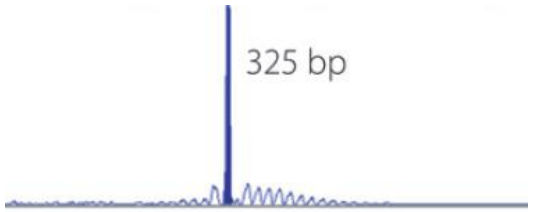






- Clonal Progression

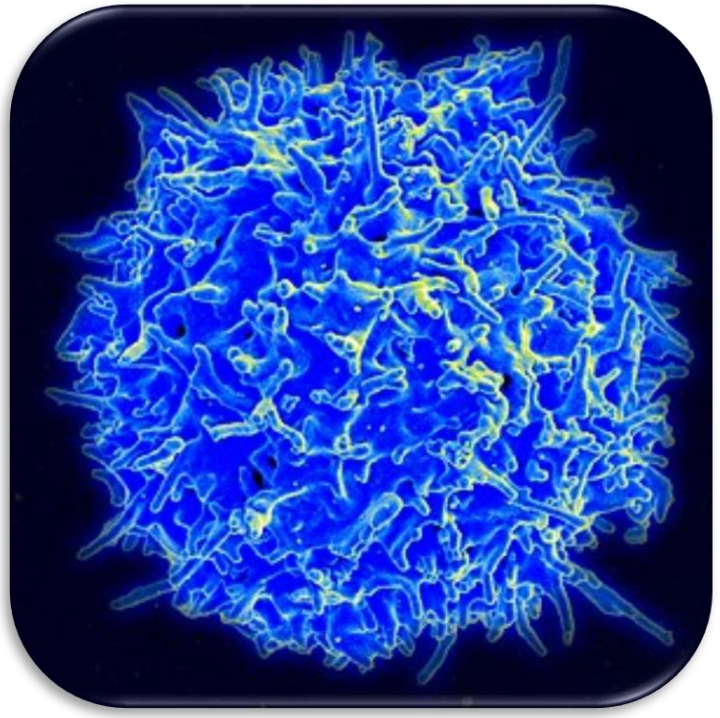




Highly Indicative of B- or T-Cell Malignancy

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Why test for B- and T-cell clonality?



Leukemias and lymphomas can be challenging to diagnose by

- morphology
- immunohistochemistry
- flow cytometry

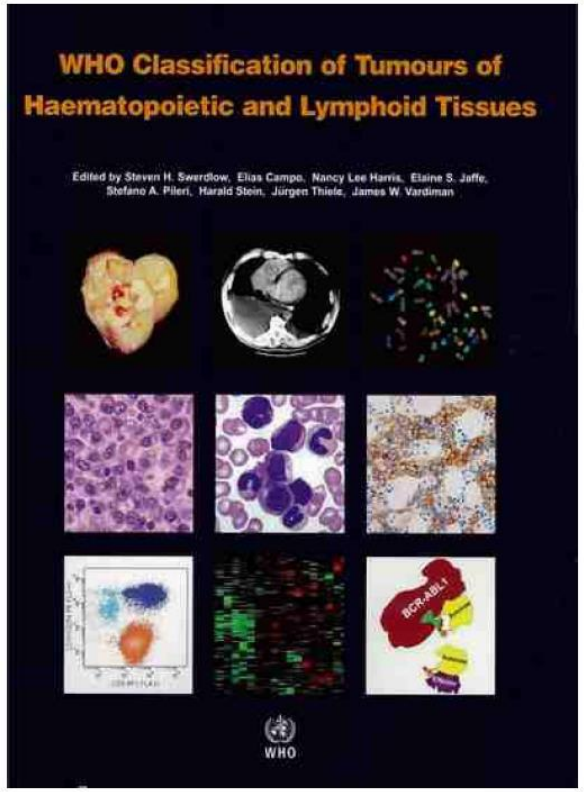
5-15% of above cases result in inconclusive diagnoses

Diagnosis of lymphoid malignancies is greatly supported and facilitated by **clonality testing**

Adopted in routine diagnostics for further MRD testing

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Why test for B- and T-cell clonality?



We are facing a growing number of hematopoietic tumors with specific or characteristic molecular changes.

Diagnosis of lymphoid malignancies is greatly supported and facilitated by **clonality testing**

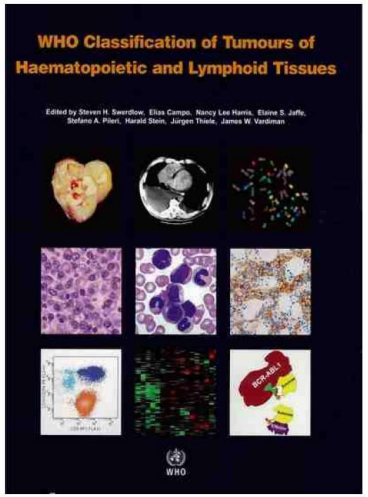
Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Why test for B- and T-cell clonality?

Monoclonality is a dominant characteristic of cancer

Allows for discrimination between :

- Reactive lesions **(polyclonal)** - generally considered **benign**
- Hematologic malignancies **(clonal)** - generally considered **neoplastic**



Aids in diagnosis:

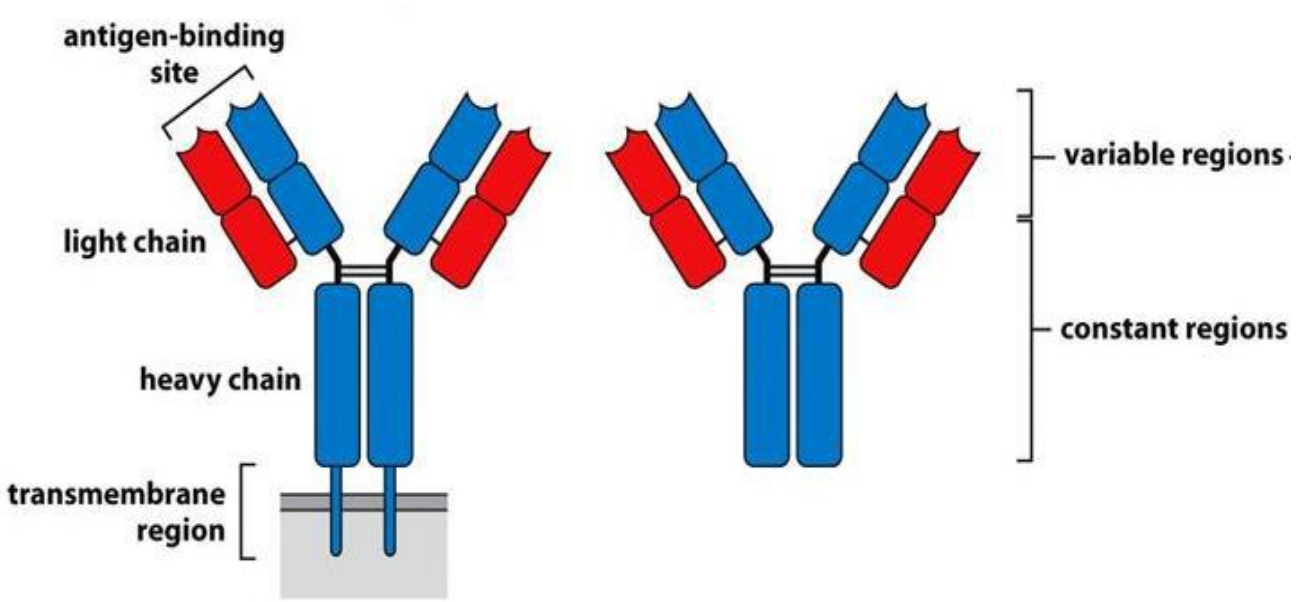
- of Minimal tumor infiltration
- on limited diagnostic tissue when the architecture is not evaluable
- of neoplastic proliferations without specific cytological, histological or immunohistochemical criteria

Helps to identify tumor-specific markers for post-treatment monitoring

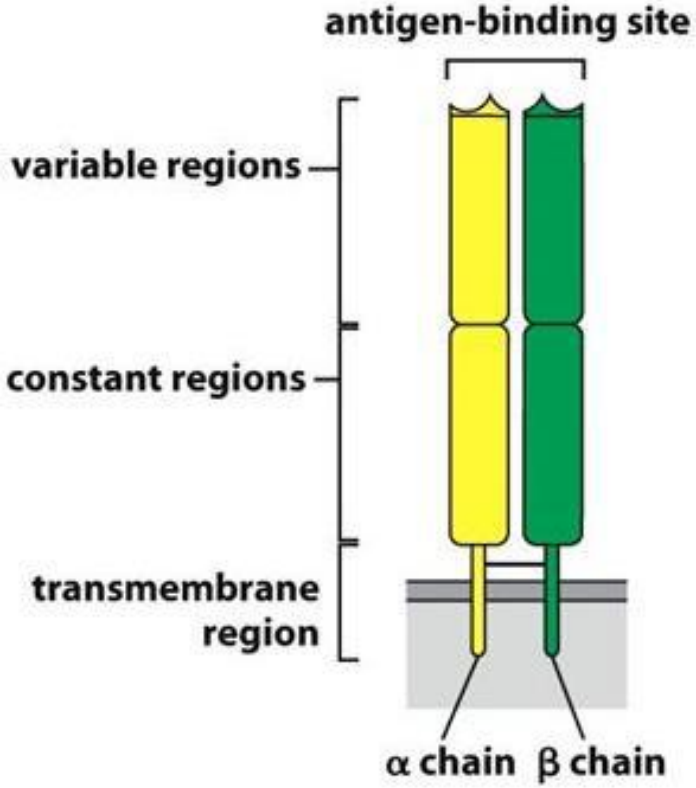
Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Clonality Targets

B-Cell Receptors (BCR)/Immunoglobulins (Ig)



T-Cell Receptor (TCR)



Each Lymphocyte has a Unique Antigen Receptor

Magnitude ~10^{12} (*i.e.*, 1,000,000,000,000) different Ig or TCR molecules

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Clonality Targets

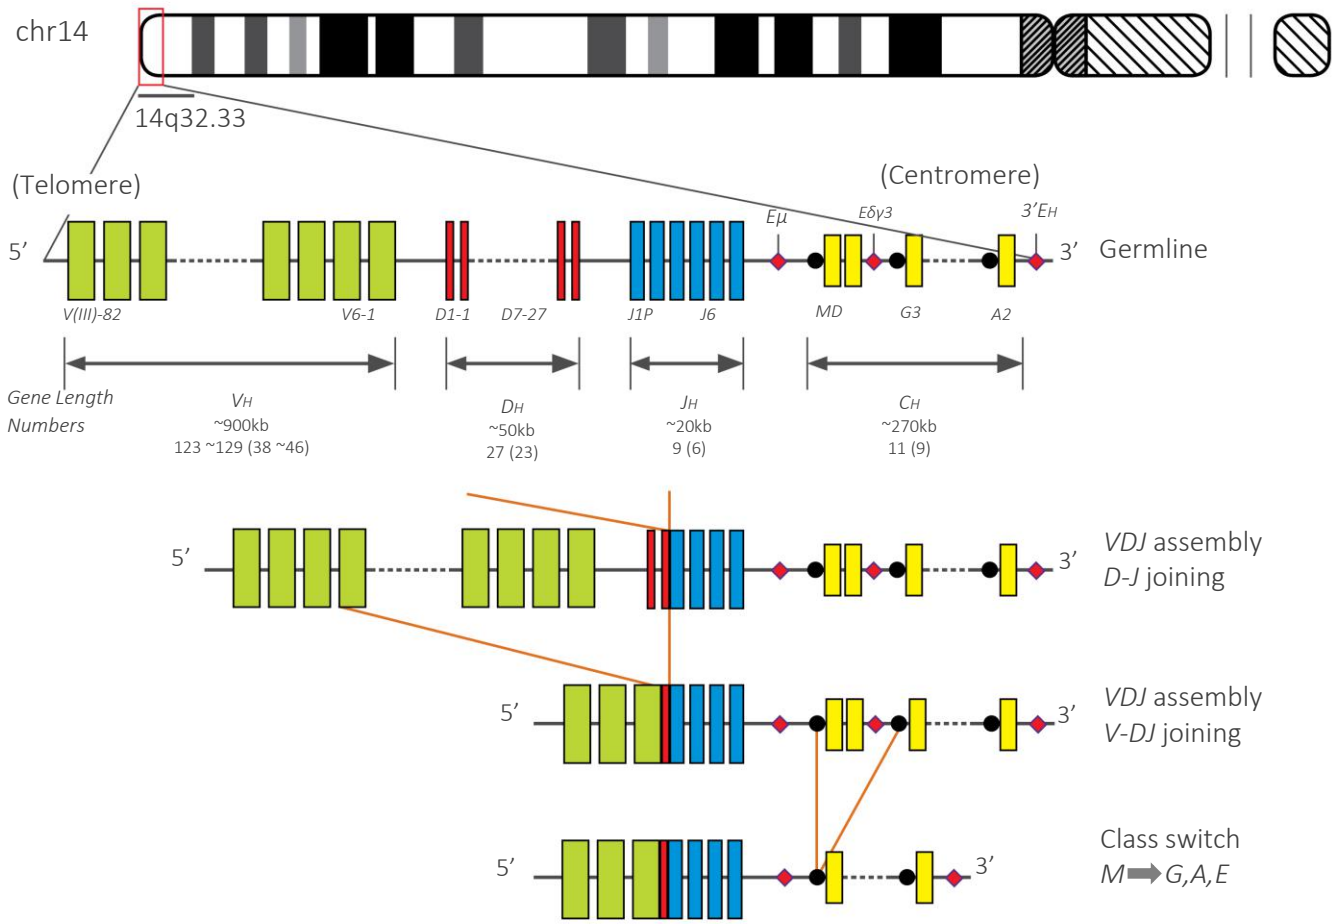
Antigen Receptor Molecules (AgRs) are the Molecular Targets

- **B- and T- Cell Receptors**
  - *IGH, IGK, IGL* (B-Cell Receptors)
  - *TRG, TRB, TRD* (T-Cell Receptors)

- **Each lymphocyte has a unique AgR** (single specificity)

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Human *IGH* Gene Locus



Dyer, M. et al., *Blood* 115:1490-1499 (2010).

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

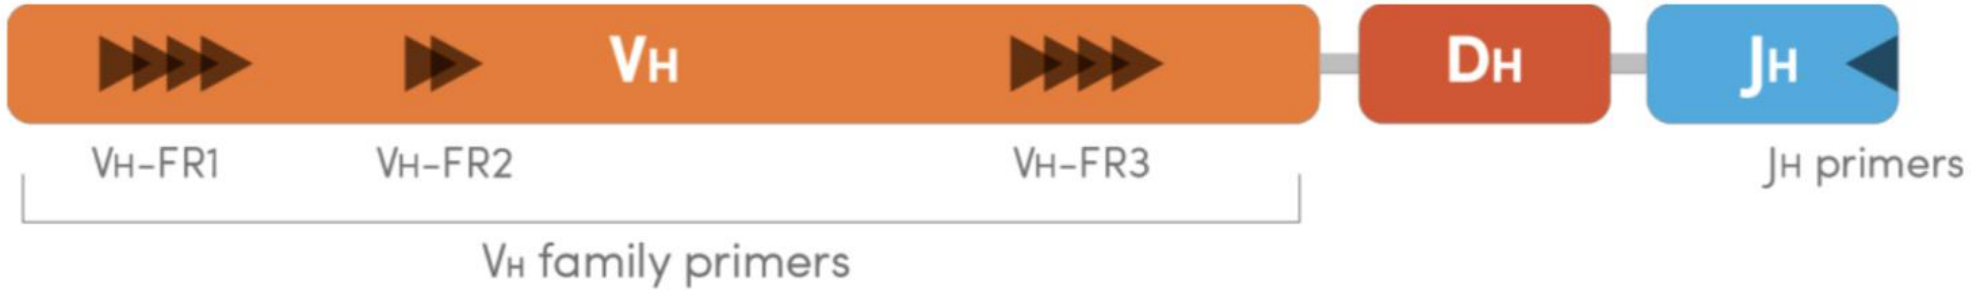
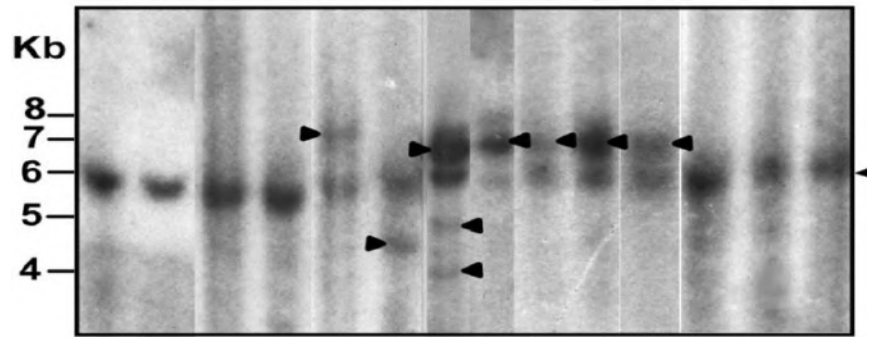
IGH Locus (14q32.33)



TRG Locus (7p14)

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Evolution of Clonality Testing



Clonality Testing was originally performed by Southern Blots

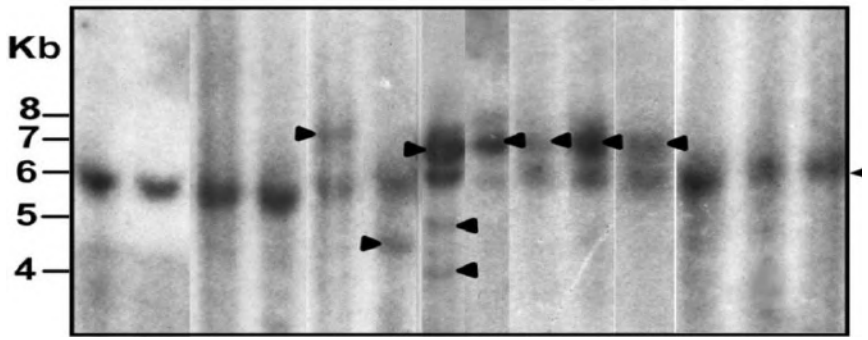
- Labor intensive
- Restricted repertoire
- High DNA quality and quantity required
- Time consuming
- Moderate limits of detection
- Subjective interpretation

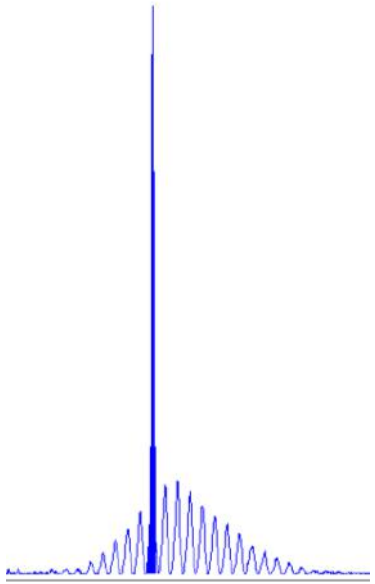
Southern Blot

Fragment Analysis / CE

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Evolution of Clonality Testing





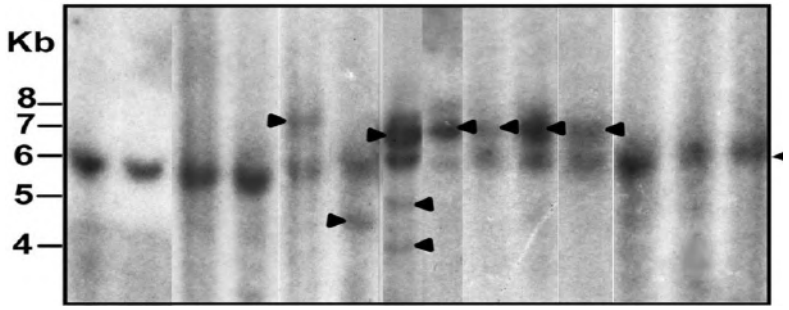
PCR-based clonality assays are now widely accepted as the gold standard, with improved :

- Sensitivity
- Testing time
- Coverage
- Limit of detection
- Sample type suitability

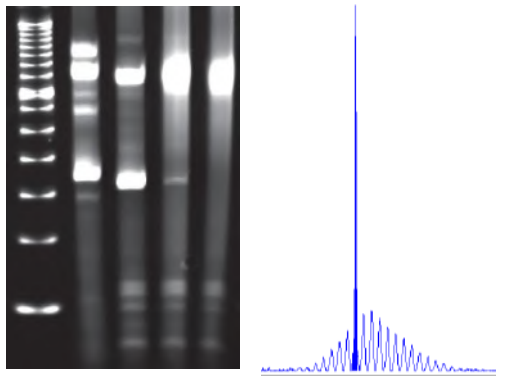
Southern Blot → **Fragment Analysis / CE** → **NGS**

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

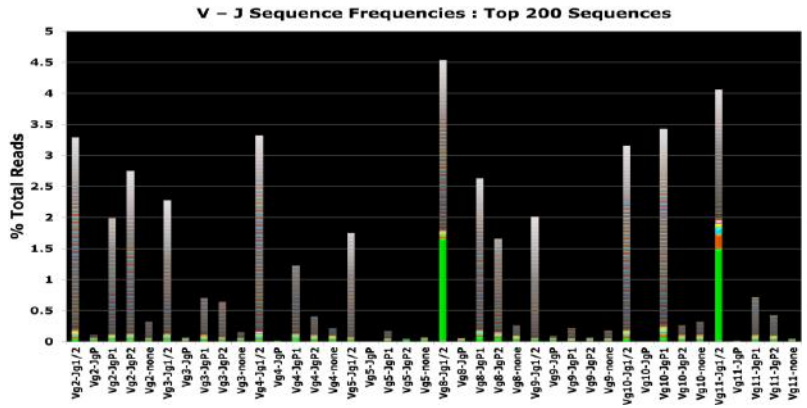
Evolution of Clonality Testing



- Labor intensive
- Time consuming
- Restricted repertoire
- Requires high DNA quantity & quality



- Increased sensitivity
- Reduced testing time
- Better coverage
- Lower limits of detection
- More sample types



- DNA sequence of clones
- Highest sensitivity
- Ability to track clones

Southern Blot → **Fragment Analysis / CE** → **NGS**

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Hematologic Malignancy Research & Testing Guide

Disease	Gene Rearrangement								Translocation				Mutations	
Recommended Primary Test / Recommended Secondary Test	IGH (V_H-J_H)	IGH (D_H-J_H)	IGK	IGL	IGHV SHM	TRB	TRD	TRG	IGH-BCL1 (CCND1)	IGH-BCL2	BCR-ABL1*	PML RARa*	FLT3	NPM1
Lymphoid/Lymphoma														
Marginal Zone Lymphoma (MZL), extranodal[12,13,27]	88%	58%	84%	29%		23%	10%	16%						
Marginal Zone Lymphoma (MZL), nodal[13]	100%	30%	80%	30%		10%	20%	10%						
Mantle Cell Lymphoma (MCL)[2,6,7,12,13,27,37]	100%	11%	100%	44%	*	9%	4%	11%	75%					
Follicular Lymphoma (FL)[3,7,12,13,27,28]	84%	19%	84%	21%		6%	5%	2%		90%				
Diffuse Large B-cell Lymphoma (DLBCL)[3,12,13,27]	80%	30%	80%	28%		21%	14%	15%		30%				
Multiple Myeloma (MM) and other Plasma Cell Neoplasms (PCN)[2,9,10,20,25]	84%	60%	57%	97%					20%					
Chronic Lymphocytic Lymphoma (CLL)[11,12,13,15,23,27,35]	100%	43%	100%	30%	*	25%	12%	18%						
B-cell Acute Lymphoblastic Leukemia (B-ALL)[4,12,14,19,21,22,27,29,30,31,32,33,34]	96%	57%	95%	20%		81%	86%	75%			30%			
Suspect B-cell Proliferations[12,26,27,33]	93%	93%	90%	40%		20%		20%						
Peripheral T-cell Lymphoma (PTCL)[12,13,14,24]	35%	4%		2%		98%		94%						
T-cell Acute Lymphoblastic Leukemia (T-ALL)[12,14,21,22,29,31]	24%	25%	4%			92%	68%	95%						
Angioimmunoblastic T-cell Lymphoma (AILT)[12,13,14]	19%	11%	30%	5%		99%	35%	92%						
Adult T-cell Leukemia/Lymphoma[39]						97%		96%						
Anaplastic Large-Cell Lymphoma (ALCL)[12,13,14]						74%	12%	74%						
T-cell Prolymphocytic Leukemia (T-PLL)[12,13,14]	3%	3%	3%	3%		100%	6%	94%						
T-cell Large Granular Lymphocytic Leukemia (T-LGL Leukemia)[12,13,14]			4%	4%		97%	29%	96%						
Suspect T-Cell Proliferations[12,26,40]	10%		10%			90%	11%	90%						
Myeloid														
Acute Myeloid Leukemia (AML)[8,16]													33%	64%
Acute Promyelocytic Leukemia (APL)[1,5,16,17]												90%		
Chronic Myeloid Leukemia (CML)[7,18,19,21,38]											87%			
Myeloproliferative Neoplasms (MPNs)[38]											10%			

Note: The percentage of samples within a given disease category were detected using each gene target. Percentages indicate the highest referenced value.

Clonality Testing Guide

- A test algorithm for suspect B-cell lymphoproliferations
- Developed in concert with the EuroClonality/BIOMED-2 group for PCR-based clonality assessment of suspected B-cell lymphoproliferative disorders

Multiplexing Targets

Why combine testing of *IGH* V-J & *IGK*?

The majority of mature B-cell malignancies can be identified by targeting three *IGH* (V_H-J_H) frameworks*

	IGH FR1 (V_H - J_H)	*IGH* FR2 (V_H - J_H)	*IGH* FR3 (V_H - J_H)	*IGH* (FR 1, 2 & 3)
MCL (n=54)	100%	98%	96%	100%
B-CLL/SLL (n=56)	95%	91%	93%	100%
FL (n=109)	73%	76%	52%	84%
MZL (n=41)	73%	85%	68%	87%
DLBCL (n=109)	68%	61%	50%	79%
Total (n=369)	79%	78%	66%	88%

Abbreviations: B-CLL, B-cell chronic lymphocytic leukemia; DLBCL, diffuse large B-cell lyn cell lymphoma; MZL, marginal zone B-cell lymphoma.

Multiplexing Targets

Why combine testing of *IGH* V-J & *IGK*?

The majority of mature B-cell malignancies can be identified by targeting three *IGH* (V_H-J_H) frameworks and two *IGK* (V_k-J_k and Kde) rearrangements*

	IGH FR1 (V_H - J_H)	*IGH* FR2 (V_H - J_H)	*IGH* FR3 (V_H - J_H)	*IGH* (FR 1, 2 & 3)	*IGK* (Vk - Jk & Kde)	Total (FR1, 2, 3 & *IGK*)
MCL (n=54)	100%	98%	96%	100%	100%	100%
B-CLL/SLL (n=56)	95%	91%	93%	100%	100%	100%
FL (n=109)	73%	76%	52%	84%	84%	100%
MZL (n=41)	73%	85%	68%	87%	83%	97%
DLBCL (n=109)	68%	61%	50%	79%	80%	96%
Total (n=369)	79%	78%	66%	88%	88%	98%

Abbreviations: B-CLL, B-cell chronic lymphocytic leukemia; DLBCL, diffuse large B-cell lymphoma; FL, follicular lymphoma; MCL, mantle cell lymphoma; MZL, marginal zone B-cell lymphoma.

Multiplexing Targets

Why combine testing of *TRB* & *TRG*?

	TRB	*TRG*	*TRB+TRG*
T-PLL(%)	100	94	100
T-LGL(%)	96	96	100
PTCL-U(%)	98	94	100
AILT(%)	89	92	95
ALCL(%)	74	74	79*
Total(%)	91	89	94 (99)*

*Approximately 20–25% of ALCL are known to have no TCR gene rearrangements and are defined as null ALCL; J.J.M. van Krieken et al. *Leukemia.* 2007 21:201-206.

Clonality can be Identified in 94% of all T-Cell Malignancies

Testing Complementary Gene Targets in Parallel Improves Confidence!

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Why Multiplexing Targets?

Easy to combine:

- *IGH* and *IGK*
- *TRB* and *TRG*

Advantages of Combining Targets:

- Highest sensitivity
- Helps confirm diagnosis in difficult cases
- Improves Reliability

B-Cell Targets

	IGH (FR1, 2 & 3)	*IGK (Vk – Jk & Kde)*	*IGH+IGK*
MCL(%)	100	100	100
B-CLL/SLL(%)	100	100	100
FL(%)	84	84	100
MZL(%)	87	83	97
DLBCL(%)	79	80	96
Total(%)	88	88	98

T-Cell Targets

	TRB	*TRG*	*TRB+TRG*
T-PLL(%)	100	94	100
T-LGL(%)	96	96	100
PTCL-U(%)	98	94	100
AILT(%)	89	92	95
ALCL(%)	74	74	79*
Total(%)	91	89	94 (99)*

Testing Complementary Gene Targets in Parallel Improves Confidence!

Quiz

Clonality is defined as a proliferation of cells originating from a single progenitor cell, producing a pool of identical clonal cells. True or False?

- **TRUE**

Why test for clonality?

- Monoclonality is a dominant feature of cancer.
- Clonality testing facilitates the diagnosis of leukemias and lymphomas.
- Clonality testing allows for discrimination between reactive lesions and hematologic malignancies.
- **All of the above**

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Quiz

The molecule targets for clonality testing are B- and T-Cell Receptors. True or False?

- **TRUE**

Which detection method is NOT available in Invivoscribe assay kits?

- Gel Electrophoresis
- **Flow Cytometry**
- Capillary Electrophoresis (ABI)
- Next-Generation Sequencing (NGS)

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Quiz

True or False? Multiplexing targets is important because:

- It increases the detection rate of clonal rearrangements
- It increases the test sensitivity
- It improves confidence in results

- **TRUE**

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.

Take Home Message

- **PCR-based Clonality Testing** of B- and T- Cell Gene Rearrangements is the worldwide Gold Standard.
- **Clonality** testing should be performed **at the minimum,** in all cases where the pathological results contradict the clinical findings.
- **Combining targets** results in excellent sensitivity.
- **NGS** allows for unprecedented **detection levels** and information.

Confidential and Proprietary Information. Unauthorized use, replication or dissemination is prohibited.
